

**WIRELESS COMMUNICATIONS SERVICES PAY PLAN
CUSTOMIZER AND NOTIFIER**

ABSTRACT OF THE INVENTION

[0041] A system, method, and program for tracking usage and reporting available resource information of a wireless communication device, such as a mobile telephone. A server, wireless device, or both, keeps a record of available resources for the wireless device. In one embodiment, a server receives a request for an application from the wireless device, enables the application, and tracks the time for which the application is enabled. After the application is stopped, the server adjusts the record of available resources to reflect the time consumed by the application and provides the updated available resource information to the wireless handset. The wireless device can assist in such monitoring of available resources, with either data storage, processing, or both.
